

Megasync for android

Continue

Descriptions : This app is an automatic file syncing and backup tool. This allows you to automatically synchronize files and folders with the MEGA (mega.nz) cloud storage and with your other devices. It is an ideal tool for photo synchronization, document and file backup, automatic file transfer, automatic file sharing between devices, ... Features : + Synchronize multiple pairs of folders + Upload files larger than 10 MB + Sync your entire cloud account with a folder on your device + Sync with multiple accounts + Protect app settings with a passcode + No advertising displayed in the app + Email support from developers + Full automatic synchronization of files and folders in both directions + Many synchronization modes. Not only in both directions, you can also choose Upload only, Upload then delete, Download only, Download mirror, ... + Very efficient, uses almost no battery + Easy to set up. Once set up, files are kept in sync without user intervention + Works reliably in constantly changing network conditions on your phone + Monitors battery level, WiFi / 3G / 4G / LTE connectivity and adapts its behavior to user preferences + Configurable autosync interval: 15 minutes, 30 minutes, every hour, ... Mega is the world's most popular cloud storage system, so it offers a downloadable version for more MEGASync features. This application is available for mobile Android and iOS, as well as for operating systems Windows, Mac and Linux, allowing you to free up your device's memory. This app allows you to synchronize the folders of your choice to transfer from the cloud to the device of your choice. In addition, you can also download files hosted on mega and share the ones you have in the cloud with other users via a link from any browser and device: computer, mobile or tablet. Index of contents MEGASync is the computer application of MEGA and although with the same account you can access the browser and desktop version, it has different characteristics that you need to know: Higher discharge capacity: The browser version has a limited download capacity per day unless you pay, while the desktop version allows you to download unlimited. Security and confidentiality: Encrypt your data end-to-end with privacy policies. It allows you to create a recovery key, enable 2-step authentication, and recover files in the event of a ransomware attack. Mail service : The mobile and browser app allows you to send messages, make calls and video calls with encrypted chat. Shared access: Share files so others can download them if they need an account via links. Note that other users can upload files to your cloud using MEGADrop. Storage capacity: Mega offers you 50 GB of free storage for creating your account. Recycling bin: After you delete a file from the cloud, it remains in the recycle bin for a period of 30 days. If the 50GB storage isn't enough for you, you can always access the paid version in its various plans. Pro Lite: 400 GB of storage and 1 TB of transfer for € 4.99 per month. Pro I: 2 TB of storage and 2 TB of transfer for € 9.99 per month. Pro II: 8 TB of storage and 8 TB of transfer for € 19.99 per month. Pro III: 16 TB of storage and 16 TB of transfer for € 29.99 per month. Download and install the latest version To download the desktop version of Mega, you can go to the official portal and choose the version according to your operating system: Windows, Mac and Linux. While for smartphones, you have to go to the application store: Play at the store O App Store. For computer Download file "MEGASyncSetup.exe", locate it in the destination folder and double-click the icon. In the "Do you want to allow this application to make changes to the device" window, click "Yes". The language window will open. Select Spanish and click "OK". The wizard opens, click on "Next". The license agreement will open, click "I am okay". Choose the user type for the program and click "Next". Choose the Start menu folder or leave the default and click "To install". Wait for the installation to complete and click "To finish". Once the installation is complete, all you have to do is log in to get started: upload, download or share the files from your computer to the cloud or to other users. For Android and iOS The mobile application will allow you to synchronize the folders of your smartphone backup photos taken with your camera automatically if you wish, as well as the creation of chats for MEGA users. How to sync folders Once the program is installed on your computer or smartphone, you can synchronize the folders you want to back up, but for this you need to create an account and log in on each device. Synchronize Desktop Folders Click on the MegaSync icon and sign in. Choose the type of installation for full or selective synchronization and click "Next". Select the local folder you want to back up, then select the destination folder under "edit" and when done click "Next." Once the synchronization is complete, click on "Finish". How to sync more folders Click on the MEGASync shortcut Click on the 3 dots at the top right, then on "Synchronizations" and finally in "Add synchronization". Select the local folder you want to backup and the destination folder in mega. Then click on OK. You can repeat this process as many times as needed to select the folders you want to back up. Enable photo uploading from a smartphone Open the app. Scroll to camera icon. To touch "Activate camera downloads". Choose the download method: "Solo Wi-Fi" or "Wi-Fi or data plan". Once done, all the photos you take with your smartphone will automatically upload to your mega cloud. You can access it from the browser or the desktop app. How to download files Depending on which version of MEGA you are using, you may download files differently. We explain the process to each. From the office Right click on the mega icon, then on the three dots in the new window and finally on "upload". In the new window, find the file you want to download and click "To open". Select the destination folder in MEGA and check the box "Always download to this destination folder" if you don't always want to repeat this process. Then click on "OK". Open the official Mega page and log in. Right-click on the cloud to open the menu, and then click "Upload a file" or "Download the file". In the new window, explore your desktop, select the file or folder you want to download and click "To open". From a laptop Open the app. Touch the sign "+" in the lower right corner of the screen. Click on "To download" and then in "From the device". Find and select the file what do you want to download. How to access your files from any computer If you are using a different computer than yours and need to access files in your MEGA cloud, you should not go to the official page and login. Remember not to save your access data on a different computer than yours for protection. Once in the cloud, in the left menu you will see the different files you downloaded in advance and you can download them for trouble-free access. How to access files from a mobile or tablet If you want to access files from your MEGA cloud, you will need to install the app on the device. Once you have done that, you need to sign in with your account on the device. Then you have to click on the cloud icon and you will see all the files you previously downloaded. Just click on each folder in your cloud to open it, then click on the different files you want to import to your device. A new window will open for you and you will just have to click on "Save to device" to start the download. One of the benefits and features of MEGA is its ease of sharing cloud hosted files from any device through a link which you can get from every app. By MEGASync Click on the MEGA icon. Hover over the file you want to share. Click on the "Clip" and you will copy the link to the clipboard. Send the link to the user who can access it from any browser. You just have to click "Descargar". Log in with your MEGA account. Right-click the folder or file that you want to share, and then click "Get the link". A new window will open with the download link. Check the box "Export the encryption key separately" if you want a protection key, copy the url and key, then share. If you do not check the key only box copy the url and share it. From a smartphone Open the app on your smartphone. Click on the three dots to the right of the file. Click on "Manage link", then click on "Copy link". It will be copied to the clipboard and only you have to share it. How to download with MEGASync The mega browser allows you to download a limited amount of data per day, but that doesn't happen with MEGASync, so it's a better option to start your download directly with the desktop app. To do this, you just need to copy the URL and paste it into the desktop version. Copy the URL of the MEGA you want to download. Click on the mega icon and in the new window click on "Open the transfer manager". In the new window you will click "Add" and then in "Open links". This will open a new window where you can paste as many Mega URLs as you want. To start the download then click on "Accept" and the download will begin. The links you placed will start to download in the queue and once the download is complete the next one will start automatically. An advantage of MEGASync is that it allows you turn off, turn on the computer and continue downloading as soon as the Internet connection is established. MEGA is a secure cloud storage service with end-to-end encryption that lets you upload files to the cloud on Windows, Mac, Linux, Android and iOS. There's a lot to unpack with MEGA, especially for users who don't have prior experience with cloud storage services, so here's the full guide on how to use MEGA. Key Takeaways: MEGA has a 20GB storage plan for free users. It allows you to backup and sync files directly from your computer to the cloud easily. MEGA has a transfer quota, which means that there's a limit to how much data you can upload or download per day. For Free accounts this is a vague limit that resets every 24 hours, whereas Pro accounts get allocated their transfer quota in bulk for the entire billing period. As we cover in our MEGA review, there's a lot to like about the cloud storage and file management that it offers. It has highly secure and private encryption and good speed. Plus, it's easy to share your files with other people, and you can sync any folder on your system. If MEGA isn't to your liking, but you still need somewhere to upload and download files, then make sure to check out our list of the best cloud storage. MEGA Backup, or simply MEGA, is a cloud storage service that lets you sync and backup your files to the cloud. It functions similarly to Microsoft OneDrive (read our full OneDrive review) and will let you sync your folders to your cloud storage. There are several reasons why MEGA might not sync. If you're sure nothing is wrong with your internet connection and that you have enough free storage, then you might have unsynced the folder or reached your daily or monthly data transfer quota. How Do I Use MEGA Cloud Storage? All you need to do to use MEGA is sign up for a free account, which comes with 20GB of storage, and either start using it through the web interface or download the desktop and mobile applications. First things first: let's start with how to sign up for MEGA cloud storage. The whole process is straightforward and simple, so this shouldn't take more than a couple of minutes. Open MEGA on Your Browser Start by going to MEGA's website and opening the service on your browser. Register and Create a Free Account At the top-right corner of your screen, click on "create account" to register for a MEGA account. Fill in Your Details to Fully Register Your New MEGA Account Once you're at the registration page, you'll have to type in your credentials to set up the new account. Enter your name, email address and a strong password. Confirm Your Email Address When you've successfully registered an account, MEGA will send you an email for a verification test. Verify your email address by pressing the "verify my email" button. Download the MEGA Desktop App Once you've registered and verified your email address, simply click the "download" button for the operating system you're using. Install the MEGA App to Your System Install the MEGA app to your desktop by opening the MEGA installer you just downloaded. Then go through the installation process and read through all the relevant information. Log in to Your MEGA Account The MEGA app should open when the installation is complete. If you haven't created an account yet, you can follow the steps of registering above. Otherwise go ahead and log in to your account to run the MEGA desktop app. Configure MEGASync Next, configure how you want MEGA to install to your computer. Full sync will sync your entire cloud drive, and selective sync will only sync specific folders. Since the free plan only comes with 20GB of space, we recommend selecting the "selective sync" option. Backing up your files with MEGA is straightforward and secure. MEGA even provides you with a recovery key in case you forgot your password or lost your two-factor authentication details. The recovery key is just a string of randomized text, so it's easy to save. This article will cover the steps for desktop users. If you're accessing MEGA through the browser or have the app installed on your iOS or Android device, then you can refer to MEGA's complete manual for the steps. How Do I Use MEGA to Sync and Unsync Files? The most basic way of interacting with MEGA is by syncing files using its default MEGASync folder. Open Your MEGASync Folder You can open your "MEGASync" folder through the application icon at the bottom-right corner of your screen. If that doesn't work, you can search for the folder in the directory provided below. By default, its location on Windows devices is: C:\Users\username\Documents\MEGASync. Move Your Files to the MEGASync Folder To backup your files or folders, just drag them to the MEGASync folder. This will start the uploading process, signified by the small blue loading icon at the bottom-left corner of your file. When the files or folders are uploaded, that blue icon will change into a green checkmark. That's pretty much it. Backing up your files is as straightforward as that, and anything you place in your MEGASync folder will automatically sync with MEGA's servers from here on out. How Do I Backup With MEGA? By default, the MEGASync folder automatically syncs your files to the cloud. However, if you want to continuously backup other folders, then you'll need to take another approach. Here's how you can sync and backup any folder to MEGA: Open the MEGA Settings Look for the MEGA icon at the bottom-right corner of your taskbar. Right-click the icon and open the "settings" page. Open the Syncs Tab On the settings screen, navigate to the "syncs" tab. Here you'll find all the files and folders on your computer synced to your MEGA cloud storage. Add Your Local Folder In the syncs tab, click on the "add" button near the bottom-right corner of the window. That will open a pop-up asking you about the local and MEGA folders. Look for your local folder by clicking on "choose" and then selecting the local folder you want to sync. Add or Create Your MEGA Folder Now it's time to add your MEGA folder, so click on "choose" to open your MEGA drive, which will show all the folders stored in your MEGA drive. You can choose where you'd like to upload your local folder, or you can always create a new folder by clicking on the "new folder" button below. Sync Your Folders When you're happy with everything, go ahead and sync your folders by clicking on "OK." Finally, hit "apply" at the bottom-right corner of your screen to implement the changes. Now that you've added your folder, any changes you make to it or the files inside of it will trigger an upload to MEGA's cloud storage, which ensures that it's backed up at all times. How to Stop Backing Up a Folder in MEGA If you want to temporarily stop backing up a folder, disabling the automatic sync is simple. Open the MEGA Settings and Syncs Tab Right-click the MEGA icon at the bottom-right corner of your screen. From there, look for and click on "settings." On the settings page, navigate to the "syncs" tab. Uncheck the Folder You Wish to Unsync Look for the folder that you want to unsync and simply uncheck the box next to it. This will stop that folder from syncing to your cloud. Hit Apply to Implement the Changes When done, just click on "apply" at the bottom-right corner of your screen. The folder(s) that you unchecked will no longer sync to your MEGA cloud. Now even though these folders are no longer syncing — meaning your online copies will be out of date — you can still find them in your MEGA drive. If you feel like deleting a sync path (the local and MEGA folder connection) for good and thus removing it from the cloud, you can always click on "delete" in the final step to delete it permanently. How Do I Download Files From MEGA? If you've completely deleted your local files and need to retrieve a backup, don't fret. You can easily download your files from MEGA without a hitch. Open the Download Window Look for the MEGA icon at the bottom-right corner of your screen and right-click it. From there, navigate to and open the "download" window. Look for the Folder You Want to Download Now look for the MEGA folder with your backups. When you've found the files you want to download, go ahead and select them, then click on "OK." Then you'll have to choose the download location. Feel free to specify a download folder. However, for this example, the default destination works for us. You can also use MEGA to share files with other people, regardless of whether or not they have a MEGA account themselves. You can do this by creating public links to files and folders and then distributing them so that you can share the data with the people you want. Here's how you go about doing that. You can use this link to give your friends or colleagues access to the files and folders you want to share, which will let them download the file to their computer. If you want to open a MEGA link, the easiest way to do it is through your web browser. However, you can also do it directly in the MEGA application by doing the following: If all you need is basic file backup, then MEGA is a competent and secure choice. Since you're not locked into the default sync folder, it's easy to set MEGA up to automatically keep your files and folders backed up to the cloud. That said, if you need or want more advanced backup options, then there are much better services out there than MEGA. For example, by creating and backing up disk images using dedicated backup software like iDrive (read our iDrive review), you can keep a copy of your entire system, which you can then restore from in the event that your device fails. Furthermore, although MEGA offers some of the largest free storage quotas out of any cloud storage provider, dedicated backup solutions are usually much cheaper per gigabyte and sometimes even provide you with unlimited storage. Because of that, if you're looking to backup large amounts of data, a service like Backblaze or Carbonite will serve you much better. That's it for our guide on how to use MEGA. Although its desktop client is a bit clunkier than it needs to be, once you get used to using the system tray, context menu options and the MEGASync folder, it becomes pretty effortless. What do you think about MEGA? Do you like its focus on secure cloud storage, or do you prefer another service? Let us know in the comments below and as always, thank you for reading. Let us know if you liked the post. That's the only way we can improve.
